

Daniel Wolf, A Metrological Survey of Ptolemaic Bronze Coins II: Alexandria First and Second Centuries BC.

AJN 33 (2021) pp. 57-120, figg.

Quantitative analysis of weights of more than 4,400 Ptolemaic bronze coins representing Alexandria's issues of the second to first century BC, from the time of Ptolemy V through the reign of Cleopatra VII. Large samples of over 40 coin types yield better weight statistics than previously published. Novel population analyses help describe and classify some types that are difficult to distinguish and enable comparisons with populations of other coin types. The distribution of some types in hoards are clarified based on quantitatively sound classifications. Suggests new hypotheses of relationships and possible weight standards for the late Ptolemaic bronze coinage.
